The Use of a Flexible Ruler in Measuring the Length of an Artificial Stapes during Stapedotomy under an Otoendoscop

General Recommendation: Good - publish after minor revision

Comments to Author:
Congratulations for your work Your study will help the current knowledge

Title and abstract
The abstract is well written and provides adequate picture of the whole manuscript!

Introduction
Yes it has! However, nowadays otosurgeons should not forget that conventional stapedotomy is relative simple intervention with excellent results! There are studies which describe stapedotomies with the conventional methods with lower cost and either good outcomes!

Material and Methods
I have no ethical concerns, the study design is appropriate! All data has been collected meticulously in a systematic way! The sample size is not huge but is still adequate to draw conclusions!

Statistical Analysis
The authors used the common widespread SPSS analysis!

Results
The results are both credible and important!

Discussion
The results are interpreted well through the discussion! The literature is also reviewed well!

Conclusions
Both logically valid and justified!

Tables and Graphics
Yes and also of high quality!

References
Yes. I suggest these publications to be added according to my comments in introduction section, in order to further strengthen the article.
